github.com/BraianMedrano Portfolio: braianmedrano.github.io

Fourth-year Information Systems Engineering student at UTN. I founded Castel Tech and lead the development of Palestra, a white-label booking platform for sports clubs. My work there covers the whole lifecycle: product and architecture, team process and code review, infrastructure, and testing in real environments. I care about knowing why something breaks before it reaches users.

EXPERIENCE

Founder & Technical Lead — Castel Tech

May 2026 – Present

Palestra: multi-tenant SaaS where each club runs under its own subdomain. Next.js + TypeScript frontend, Go API, PostgreSQL. Team of four developers.

- Defined the product (white-label SaaS instead of a marketplace) and set up how the team works: backlog, GitHub Projects board, issue templates and review rules. I'm the main code reviewer for both repos.
- Bootstrapped both codebases: the Go API (Gin, GORM, clean architecture, Docker) and the Next.js frontend with Vitest and Playwright. Set up CI on GitHub Actions for both, and built backend endpoints for courts, pricing and sports.
- Built the frontend design-token system and typography from the product design, with automated accessibility contrast tests.
- Set up the server: an Ubuntu VPS with Docker, Nginx as a reverse proxy, and HTTPS through Cloudflare, with a firewall that only accepts Cloudflare traffic. Also configured DNS, subdomains, and transactional email with Resend (SPF, DKIM, DMARC) plus mailbox forwarding.
- Deployed sign-in to a real environment and found three bugs the mocked tests had missed: the origin check failed behind Nginx, Google's callback carried extra parameters our parser rejected (fixed), and the session cookie had no expiry, so Safari on iPhone logged users out. Wrote up the root cause and the release order across both repos.
- In code review, I blocked the Google sign-in work until the OAuth state was tied to the browser that started the login, which closed a login CSRF hole before it reached production.
- Introduced an iterative, spec-based workflow for the team (Organic-Driven Development), with shared project memory on a server I self-host (gentle-ai, Engram). Every change is verified before it's merged.

Chatbot Developer — Henko

Mar 2025 – Dec 2025

- Built LLM-powered WhatsApp chatbots on Chatsell that booked appointments in Google Calendar, updated spreadsheets and sent files from Google Drive.
- Worked directly with clients from onboarding to launch. I met with them to learn how each business worked, adjusted the bot based on their feedback, and gave technical support once it was live.

PROJECT

Gestor Académico

Sep – Oct 2026

A local-first web app for UTN students. I designed the product, the business rules and the specs. It imports SysAcad pages without asking for credentials, maps course prerequisites, tracks finals and progress, and finds class schedules with no time clashes. Hexagonal architecture, tested with Vitest, deployed to Netlify.

EDUCATION

Information Systems Engineering

UTN Facultad Regional Tucumán · 4th year · expected 2028

AI Automation (n8n)

Coderhouse · certificate

LANGUAGES

Spanish (native) · English, C1 Certificate, ATICANA (2025)

Currently taking OPI 2.0, a communication course by Franco Pisso

SKILLS

Development: Go (Gin, GORM), TypeScript, React, Next.js, Tailwind CSS, REST APIs, PostgreSQL, C#/.NET

Testing: Vitest, Playwright, Go tests, cross-browser and device testing, code review

Infrastructure: Linux, Docker, Nginx, Cloudflare, GitHub Actions

Workflow: Organic-Driven Development (ODD), spec-driven development, AI-assisted development, gentle-ai, Engram
